

BP-02: Avoiding Monitoring Gaps

BP-02: Percentage of cases where blood pressure monitoring gaps greater than 10 minutes were avoided.

Algorithm determining Measure Start/End Times:

Measure start:

First Blood Pressure documented after the latest of these 3 times:

- First documented **Anesthesia Start** time.
- First documented **Patient In Room** time.
- First **Data Capture Start** time.

*For cesarean delivery cases converted from labor epidural as determined by **Obstetric Anesthesia Type: Cesarean Delivery Start Time** is used as the 'Measure Start Time'.

Measure End:

- **Anesthesia End.**

A measurement gap is defined as >10 minutes between consecutive blood pressure readings.

Both non-invasive and invasive BP measurements are considered.
